

About pfmmedical

pfmmedical is a leading internationally active company in the healthcare sector. The headquarter of the family-owned enterprise, founded in 1971, is located in Cologne. The company's 710 employees are active at 12 sites. Its portfolio of more than 1,800 products sold in more than 100 markets includes the medical focus fields of infusion, histotechnology, cardiovascular technologies and surgery.

Development, production, sales and service from a single source

In its own production facilities, pfmmedical develops and manufactures medical-technical products used in hospitals, medical practices, laboratories and in home-care. In addition, the company exclusively sells products for internationally leading manufacturers such as scalpels and blades for laboratory equipment made by the Japanese manufacturer FEATHER®. Services for outpatient care round off the portfolio of the medium-sized family-owned business. Services such as medical-nutritional consultation and prescription management aim at providing as comprehensive a supply for home-based care as possible.

Safety and quality made in Germany

Producing and offering premium quality is a fundamental principle for pfmmedical. At the same time, the aim of its product development is to ensure the highest possible level of safety for users and patients. To ensure top quality and safety standards along the entire value-chain, pfmmedical develops and produces its products at sites primarily in Germany, but also in Switzerland and the USA.

Flexibility and customer orientation drive innovation capability

This location policy provides the company with the flexibility to rapidly adjust to market demands and customer preferences. In close cooperation with recognized specialists, based on their practical experience, pfmmedical systematically develops new production processes using different materials. This enables the company to offer its customers solutions adapted to the needs of patients and users that can accelerate a successful cure as well as improve medical care. Over 470 issued patent rights in over 175 patent families are the result of over 50 years of successful collaboration.

Products and services for greater quality of life

Whether with products or services – pfmmedical sets equal store to the functional benefit as to the patients' quality of life.

The pfmmedical titanium-coated net implants, such as the TiLOOP® Bra Pocket used in reconstructive breast surgery, not only provide stability, but due to their high biocompatibility also grow significantly faster into the body tissue than conventional implants. Among other things, they ensure low inflammation rates and shorter convalescence times for patients.

In the area of cardiovascular surgery, the unique Nit Occlud® Spiral System is used for closing holes in the heart. The implants can be used for children already as they adapt themselves to the organ's growth, so that they can remain in the body for an entire lifetime.

Apart from products tailored to customers' needs, pfmmedical also offers services that allow complex treatments to be shifted from the hospital to the home environment. This for example provides palliative-care patients a higher degree of self-determination, in regard to where they spend their last days – an important factor for their quality of life.
